Mailjet plugin

Installing the plugin

First unzip the contents of the ZIP file and then install using the wizard.

1. Open the Workflow Configuration tool .
2. In the Plug-In Bar, click on the two black arrows with the black triangle underneath, at the bottom right area of the window pane.
3. In the popup menu, select "Import Plug-in" and select the **Mailjet.ppk** file.
4. If an older version of the plugin is already installed, a warning will be shown, asking if you want to overwrite the existing file. Click OK. In this case you must restart Workflow to allow proper reloading of the plugin. If you do not restart Workflow, the plugin will not function correctly. All existing instances of the plugin in Workflow processes must also be replaced by the new version.

You can now find the **Mailjet plugin** in the **Email Services** category of the Plug-In Bar.

> **Note**
>
> No third party system resources are incorporated directly into this OL product. This means that while the plugin was tested against the associated third party systems when initially released, they may behave differently with later versions of that system. Use at your own risk.
>
> Should you encounter any issues, please contact your local Objectif Lune Support team and we will do our best to help.

Testing the plugin

To test the plugin, drag it from the Plug-In Bar into a process. The plugin configuration dialog will open and show the index property page. If that works, the plugin is installed correctly and ready for use.

Note

Further help can be found by pressing **F1** or the **Help** button in Connect Workflow from the "Mailjet plugin" dialogue or by searching for "Mailjet plugin" in the Workflow product documentation at help.objectiflune.com
